10. Stability and reactivity

Reactivity None under normal use conditions.

Chemical stability

For the lead component: When oxygen is present, it will be eroded by pure water and the weak organic acid. At normal temperature, it will be eroded by fluorine or chlorine.

For the sulfuric component: At first, vapor is generated by heating and generate sulfuric acid vapors if continue to heat. Rapid contact with water might generate a large amount of heat, and sometimes the acid is scattered. Dilute sulfuric acid, which is generated by diluting with water, generates hydrogen gas by the corrosion of various metals and may cause flash

explosion by mixing with air.

Possibility of hazardous reactions Lead component:
React violently with combustible materials and organic matter (sulfuric acid, hydrogen peroxide, phosphoric acid), and it may cause risk of fire.

Sulfuric acid component:
Reacts violently with bases and is corrosive to most common metals forming a flammable/explosive gas (hydrogen).

Conditions to avoid Exposure to air or moisture over prolonged periods. Excessive heat.

Incompatible materials Acids, Bases, Oxidizing agent.

Hazardous decomposition products None known based on information supplied.
