MANAGING MULTIPLE TENANTS WITH TRELLIS™ PLATFORM

A Vertiv Application Brief

OVERVIEW

Large Enterprises can now host multiple tenants or locations on the same instance of $Trellis^{M}$. These tenants can perform their duties based on permissions granted. Operating via a single instance with multiple users helps simplify, streamline and delegate responsibilities at a local level.

Problem

Visibility and management of multiple tenants within a given location is critical for colocation facilities. Being able to assign responsibility and still maintain a comprehensive view of all facilities can be challenging. Colocation facilities face a unique challenge in needing to delegate access to data for certain individuals while keeping it private to others — all while being able to see all data at an administrator level.

Solution

With the *Trellis*[™] Platform, you can assign responsibilities at various locations; locally or geographically. By providing a single instance of *Trellis*[™] in which multiple tenants can operate and perform their duties, you're ensuring that everyone has access to the data they need.

Trellis[™] Enterprise allows you to streamline your multi-tenant locations by:

- Segmenting groups and tenants based on location or department.
- Giving users access to the data they need and keeping private data secure.
- Allowing tenants to manage their own administration tasks and users.
- Maintaining a holistic view of all segmented groups.
- Providing one integrated, software solution for multiple instances.
- Building trust with your tenants that their equipment is effectively managed.
