Achieve power system consistency and regulatory compliance with expert battery replacement

Batteries are electrochemical devices that require regular checks to ensure safe and proper operation. As soon as they are placed into service, it is important to maintain batteries with a program that identifies system anomalies and trends end of life. It is this battery performance information, along with the extensive industry experience leveraged by Vertiv™ technicians, that allows you to truly understand battery health and ensure timely, cost-effective replacement.

Benefits

- Improve UPS availability
- Reduce risk of system failure and unplanned downtime
- Minimize emergency repairs
- Ensure environmental compliance
**New Battery Installation**

From minor to major power outages, each time your battery system is discharged, it shortens the life span of your battery system. Typically, batteries start to lose capacity or fail within three to five years, depending on usage and environmental conditions. Batteries kept in service beyond expected service life are at risk for failure.

Therefore, Vertiv™ offers complete battery replacement services starting with expert installation of new cells. We stock approximately $1 million in battery inventory, and our factory-trained technicians replace several thousand battery strings annually, which means we have fresh battery inventory with the newest date codes.

**Spent Battery Recycling**

As part of your battery replacement service, you can trust Vertiv to properly dispose of and recycle your old batteries in accordance with all government and industry regulations. This includes the management of any regulatory paperwork you require.

**UPS Restart**

Once your battery replacement is complete, our technicians will restart your UPS system and certify that it is operating properly to protect your critical infrastructure.

---

**Summary**

Studies have shown that the majority of UPS system failures are battery related. They are the weakest link of your emergency power system.

The actual service life of batteries is almost always shorter than the design life indicated by the manufacturer, which is why they should be maintained with a program that identifies system anomalies and performance trends. Utilizing this system data, along with Vertiv’s infrastructure and industry expertise, ensures timely, cost-effective replacement for improved availability.
